

XAUUSD Confluence EA — Quick Start

MQL5 Expert Advisor for MetaTrader 5 · 2-of-3 confluence strategy for Gold (XAUUSD) · M5 entries

Install

- 1 MT5 → **File** → **Open Data Folder** → copy XAUUSD_Confluence_EA.mq5 into the MQL5/Experts/ folder. Works the same on Windows and macOS.
- 2 Open **MetaEditor** (Tools → MetaQuotes Language Editor, or F4 / fn+F4 on a Mac), double-click the file, press **F7** to compile → confirm "0 errors".
- 3 Back in MT5: right-click **Navigator** → **Expert Advisors** → **Refresh** if it is not listed yet.

Enable & Attach

- 1 Click the **AlgoTrading** toolbar button ON (Tools → Options → Expert Advisors → allow algo trading).
- 2 Open a chart for your broker's Gold symbol (XAUUSD / XAUUSDm / GOLD). **Set the chart to M5** — cosmetic only, the EA reads M5 + H4 from its own inputs.
- 3 Navigator (Ctrl+N / Cmd+N) → Expert Advisors → drag **XAUUSD_Confluence_EA** onto the chart.

Load the Preset (.set file)

- 1 In the EA dialog's **Inputs** tab, click **Load** and select XAUUSD_Confluence_EA_Default.set.
- 2 Check "Allow Algo Trading" on the **Common** tab, then click **OK**. A smiley face on the chart = EA running.
- 3 If the timeframe inputs (Working/Trend) don't load from the preset, set them manually: Working = **M5**, Trend = **H4**.
- 4 **On a Mac?** MT5 for macOS runs this EA natively — nothing else needed. (The Python version of this strategy needs Windows.)

Test Before Trading Real Money

- 1 **Strategy Tester** (Ctrl+R): XAUUSD, "Every tick based on real ticks", multi-year range → check equity curve & drawdown.
- 2 **Demo account**: run live on demo for several weeks to confirm real fills/spread match the backtest.
- 3 **Live**: start with low risk % (see table) and monitor around major news (NFP, FOMC, CPI) — no news filter is built in.

What It Does / Key Inputs

Entry — 2 of 3 confluences, at least 1 confirmed. All computed on M5:

- 1 **Trend** H4 EMA200 bias + M5 EMA20/50 aligned with a recent cross (confirmed: EMAs separated $\geq 0.25 \times \text{ATR}$).
- 2 **Momentum** MACD side + turn, RSI past 50 but not extreme (confirmed: histogram expanding + RSI 5 past 50).
- 3 **Strength** ADX ≥ 22 , +DI/-DI aligned (confirmed: ADX ≥ 28 , DI gap ≥ 8).

Bollinger acts as a *veto*, not a vote. At 2/3 the trend leg is optional, so counter-trend entries are possible — set `InpRequireTrendConfluence` to block them.

Score gate: the setup must also score $\geq 50/100$ (`InpMinConfidence`). With the **06:00-23:00 Oman (GMT+4)** session that gives **~4.6 fills/day** (~23/week). Session hours are GMT-offset based, not broker time. The score is indicator agreement, *not* a win probability.

Only the EMA200 macro bias reads H4, and it feeds the trend *pass* test, never a confirmation.

Exit/Risk: fixed **0.01 lots** (~\$6/trade, \$24 across 4), ATR stop & target, breakeven + ATR trailing stop, daily-loss breaker, spread/weekend filters.

Timeframes: M5 + H4 come from `InpWorkTF` / `InpTrendTF` regardless of the chart. Attach to **one M5 chart only** — a second instance trades against the first.

Input	Default	Meaning
InpMinConfluences	2	Confluences needed to enter
InpRequireConfirm	true	Need a confirmed confluence
InpMinConfirmed	1	How many must be confirmed
InpRequireTrendConfluence	false	Block counter-trend entries
InpUseFixedLot	true	Fixed size, not risk %
InpFixedLot	0.01	Lots per trade (~\$6 risk)
InpWorkTF	M5	Entries checked at each close
InpMaxOpenPositions	4	Positions at once (~\$24 risk)
InpAllowOpposite	false	No simultaneous buy + sell
InpMaxTradesPerDay	0	0 = no daily cap
InpMinConfidence	50	Min score (~4.6 fills/day)
InpSessionStartHour	6→23	Oman GMT+4, not broker time
InpMaxDailyLossPct	3.0	Halts trading for the day

■ **No trading system guarantees profit.** Gold is volatile and news-sensitive. Backtest across market regimes, demo-test, and only risk capital you can afford to lose. Verify your broker's XAUUSD specs (tick value/size, stops level, filling mode) first. No economic-calendar news filter. Testing gives ~9.3 signals and ~4.6 fills a day (~23/week), from synthetic bars with uniform volatility — real gold is quieter early in the Oman window, so expect fewer.
