

XAUUSD Confluence EA — Quick Start

MQL5 Expert Advisor for MetaTrader 5 · 2-of-3 confluence strategy for Gold (XAUUSD) · M5 entries

Install

- 1 MT5 → **File** → **Open Data Folder** → copy XAUUSD_Confluence_EA.mq5 into the MQL5/Experts/ folder. Works the same on Windows and macOS.
- 2 Open **MetaEditor** (Tools → MetaQuotes Language Editor, or F4 / fn+F4 on a Mac), double-click the file, press **F7** to compile → confirm "0 errors".
- 3 Back in MT5: right-click **Navigator** → **Expert Advisors** → **Refresh** if it is not listed yet.

Enable & Attach

- 1 Click the **AlgoTrading** toolbar button ON (Tools → Options → Expert Advisors → allow algo trading).
- 2 Open a chart for your broker's Gold symbol (XAUUSD / XAUUSDm / GOLD). **Set the chart to M5** — cosmetic only, the EA reads M5 + H4 from its own inputs.
- 3 Navigator (Ctrl+N / Cmd+N) → Expert Advisors → drag **XAUUSD_Confluence_EA** onto the chart.

Load the Preset (.set file)

- 1 In the EA dialog's **Inputs** tab, click **Load** and select XAUUSD_Confluence_EA_Default.set.
- 2 Check "Allow Algo Trading" on the **Common** tab, then click **OK**. A smiley face on the chart = EA running.
- 3 If the timeframe inputs (Working/Trend) don't load from the preset, set them manually: Working = **M5**, Trend = **H4**.
- 4 **On a Mac?** MT5 for macOS runs this EA natively — nothing else needed. (The Python version of this strategy needs Windows.)

Test Before Trading Real Money

- 1 **Strategy Tester** (Ctrl+R): XAUUSD, "Every tick based on real ticks", multi-year range → check equity curve & drawdown.
- 2 **Demo account**: run live on demo for several weeks to confirm real fills/spread match the backtest.
- 3 **Live**: start with low risk % (see table) and monitor around major news (NFP, FOMC, CPI) — no news filter is built in.

What It Does / Key Inputs

Entry — 2 of 3 confluences, at least 1 confirmed. All computed on M5:

1 Trend H4 EMA200 bias + M5 EMA20/50 aligned with a recent cross (confirmed: EMAs separated $\geq 0.25 \times \text{ATR}$).

2 Momentum MACD side + turn, RSI past 50 but not extreme (confirmed: histogram expanding + RSI 5 past 50).

3 Strength ADX ≥ 22 , +DI/-DI aligned (confirmed: ADX ≥ 28 , DI gap ≥ 8).

Bollinger is a veto, not a vote. At 2/3 the trend leg is optional, so counter-trend entries are possible — InpRequireTrendConfluence blocks them.

Score gate: the setup must also score $\geq 50/100$ (InpMinConfidence) — roughly **4.6 fills/day** (~23/week). The score is indicator agreement, not a win probability.

Session: the EA reads the **broker's own trading hours** for the symbol, so it follows broker DST, gold's daily break and Friday's early close by itself. No entries for 5 min after the open or 30 min before the close, and **every position is closed 10 min before the session ends** — nothing is held through a close or over a weekend.

Only the EMA200 bias reads H4, feeding the trend pass test, never a confirmation.

Exit/Risk: fixed **0.01 lots** (~\$6/trade, \$24 across 4), 60/30 pip stop & trail, breakeven, spread filter. **Daily frame +0.5% / -1.0%** — trading stops at either edge, and the target closes open trades to bank it.

Timeframes: M5 + H4 come from the inputs, not the chart. Attach to **one M5 chart only**.

Input	Default	Meaning
InpMinConfluences	2	Confluences needed to enter
InpRequireConfirm	true	Need a confirmed confluence
InpRequireTrendConfluence	false	Block counter-trend entries
InpUseFixedLot	true	Fixed size, not risk %
InpFixedLot	0.01	Lots per trade (~\$6 risk)
InpWorkTf	M5	Entries checked at each close
InpMaxOpenPositions	4	Positions at once (~\$24 risk)
InpMaxTradesPerDay	0	0 = no daily cap
InpMinConfidence	50	Min score (~4.6 fills/day)
InpUseBrokerSession	true	Use broker trading hours
InpFlattenBeforeCloseMin	10	Close all N min before close
InpDailyTargetPct	0.5	Bank the day at +0.5%
InpMaxDailyLossPct	1.0	Halt the day at -1.0%

■ **No trading system guarantees profit.** Gold is volatile and news-sensitive. Backtest across market regimes, demo-test, and only risk capital you can afford to lose. Verify your broker's XAUUSD specs (tick value/size, stops level, filling mode) first. No economic-calendar news filter. Testing gives ~4.6 fills/day from synthetic bars with no edge in them — frequency only, never profit.
